

Stabilus IndustryLine oil dampers are used for slowing down moving weights.

Oil dampers are closed, maintenance-free hydraulic elements which are used for the smooth slowing of feed units, linear drive units, flaps, etc.

Fixed dampers work in extension, compression or in both directions and can hold up from 50N to 2500N. All fixed dampers are available in different sizes in steel and stainless steel AISI 303/304 and AISI 316L/316Ti.

In addition to fixed oil dampers Stabilus IndustryLine also offers adjustable oil dampers. Adjustable dampers are used when the exact damping force needed is unknown. The damping force can be increased or decreased by turning the piston rod. So we always provide the perfect solution for your application.
